(a)
alignment with the flip direction
flipped sq., TPR direction: +0.188
flipped sq., linear-probe direction: +0.205
one unflipped disc per event (null): -0.003
share of $\|\Delta'\|^2$ along it
flip at s
2.39%
null
0.49%
0%
2%
3%
density over events (n = 1,596)
cos(Δ′, predicted flip direction at s)
Δ′ = act(P+m) − act(P+m'), flip-attributable
(b)
edit effect against collateral
solid = counterfactual-only squares, dotted = real-only
TPR edit
linear-probe edit
damage control: legal set (n = 1,370), |Δ|≤0.07
random direction, magnitude-matched (null)
0.03
0.06
0.09
0.12
0.18
0.24
0.37
0.49
0.14
0.29
Δ next-move log-mass (nats)
↑ onto the un-flipped board's squares,
↓ off the real board's
collateral: other squares (of 63) whose decoded class changed
